1 About This Guide

1.1 Purpose

Gowin Programmable IO (GPIO) User Guide provides descriptions of the level standard, banking of the input/output buffer, and input/output logic functions supported by GOWINSEMI FPGA products. Gowin GPIO architecture and Gowin Software usage are also provided to help you better understand the GPIO functions and rules.

2 GPIO Overview

Gowin GPIO meets a variety of I/O standards and supports both single-ended and differential level standards, providing an easy connection with external buses, storage devices, video applications, and other standards.

The basic blocks of the GPIO in the GOWINSEMI FPGA products are IOB, including I/O buffer, I/O logic, and the relevant programmable routing unit. The programmable routing unit is similar to the CRU in CFU.

As shown in Figure 2-1, each IOB contains two pins (A and B). They can be used as a differential pair or as a single-end input/output. The I/O buffer supports both single-ended and differential standards. The I/O logic supports deserializer, serializer, delay control, and byte alignment, and is suitable for high-speed data transmission. The programmable routing unit is used to inter-connect I/O blocks with other on-chip resources.

Figure 2-1 IOB Structure View

The features of the input/output blocks in Gowin FPGA series are:

- V_{CCO} is supplied based on bank.
- Supports LVCMOS, PCI, LVTTL, LVDS, SSTL, and HSTL.
- Some devices^[1] support MIPI level standard and MIPI I3C OpenDrain/PushPull conversion.
- Support input hysteresis option
- Support output drive strength option
- Support output slew rate option
- Support individual bus keeper, pull-up/down resistor, and open drain output options
- Support hot socket
- I/O logic supports SDR mode and DDR mode, etc.

Note!

[1]: For devices that support MIPI and I3C, please refer to the devices supported of 3.6.9, 3.6.10 and 3.6.12.

3 Input/Output Buffer

3.1 GPIO Level Standard

GOWINSEMI FPGA products support both single-ended and differential standards. The single-ended standard can use built-in IO voltage as a reference voltage or any I/O voltage as an external reference voltage input. All banks in GOWINSEMI FPGA products support differential input. Emulated LVDS differential output is implemented by using external resistors and differential LVCMOS buffer output. For banks supporting true LVDS differential output and differential input matching, please refer to [3.2 GPIO Banking](#) for more details.

For the pin voltage requirements for different level standards supported by GOWINSEMI FPGA products, please refer to the "I/O Level Standards" section in the corresponding data sheets:

3.2 GPIO Banking

The generic attributes of GPIO are:

- All banks support emulated LVDS differential output using external resistance.
- All banks support pull up, pull down, and bus-keeper settings.
- Each bank supports one kind of pin voltage.
- Each bank supports one reference voltage signal, whether it is from an external pin or from the internal reference voltage generator.

3.3 Power Supply Requirements

GOWINSEMI FPGA products can be powered and operated when V_{CC} and V_{CCO} reach a certain threshold and POR is set. By default, the GPIO is tristate input weak pull-up for blank chips. There are no power-on and power-off sequence requirements for core voltage and pin voltage for GOWINSEMI FPGA products.

Each bank supports one reference voltage input (V_{REF}). Any I/O in one Bank can be configured as an input reference voltage. To support SSTL and HSTL, the reference voltage can be set as half of the I/O voltage. The input reference voltage can also be generated by the internal reference voltage generator. The internal reference voltage generator and the external reference voltage cannot be effective at the same time because each bank has only one reference voltage.

The GOWINSEMI FPGA GPIO includes two input/output pins, marked as A and B respectively. Pin A corresponds to the T (True) of the differential pair, and Pin B corresponds to the C (Comp) of the differential pair.

3.3.1 LVCMOS Buffer Configuration

All GPIOs contain LVCMOS buffers. These LVCMOS buffers can be configured in a variety of modes to support different applications. Each LVCMOS buffer can be configured as weak pull-up, weak pull-down, and bus-keeper. The pull-up and pull-down offer a fixed characteristic, which is useful when creating wired logic such as wired ORs. The bus-keeper latches the signal in the last driven state, holding it at a valid level with minimal power consumption. Input leakage can be reduced by turning off the bus-hold circuit.

All LVCMOS buffers have programmable drive strength. Please refer to the corresponding data sheets for the detailed drive strength of different IO standards. The drive strength of GOWINSEMI FPGA products is guaranteed with minimum drive strength for each drive setting.

The de-hysteresis setting is used to prevent quick successive changes of levels in a noisy environment. All LVCMOS buffers support the de-hysteresis setting.

The slew rate setting takes effect at both the rising edge and the falling edges. The LVCMOS buffer can be configured for either low noise (SLOW) or high speed performance (FAST).

When a differential pair is configured as two single-ended pins, the relative delay between the two pins is maintained at a minimum, and the signal consistency is the best.

3.3.2 Differential Buffer Configuration

When a GPIO buffer is configured as a differential receiver, the input de-hysteresis and bus-hold will be disabled for the buffer.

BANK0 in GW1N devices supports on-chip programmable 100 Ohm input differential matched resistance.

BANK0/1 in GW2A devices supports on-chip programmable 100 Ohm input differential matched resistance.

All the single-ended GPIO buffer pairs can be configured to support emulated LVDS differential output standards, such as LVPECL33E, MLVDS25E, BLVDS25E, etc. An off-chip impedance matching network is also required.

3.4 Emulated Differential Circuit Matching Network

3.4.1 Emulated LVDS

GOWINSEMI FPGA products can build compatible LVCMOS output standards via the complementary LVCMOS output and external matching network. Figure 3-1 shows the external matching network.

3.5 GPIO Software Configuration

You can set GPIO location, attributes, etc. through Floorplanner in Gowin Software, or you can customize the CST file to achieve this. The following is a detailed description of the physical constraints supported by CST files.

3.5.1 Location

Lock the physical location of GPIO:

```
IO_LOC "xxx" H4 exclusive;
```

3.5.2 Level Standard

Set the level standard for GPIO:

```
IO_PORT "xxx" IO_TYPE=LVC MOS18D;
```

3.5.3 Drive Strength

Set the drive strength of output pins or IO pins:

```
IO_PORT "xxx" DRIVE=12;
```

3.5.4 Pull Up/Pull Down

Set pull up/down modes, such as UP (pull-up), DOWN (pull down), KEEPER (bus-hold), and NONE (high impedance).

```
IO_PORT "xxx" PULL_MODE=DOWN;
```

3.5.5 Voltage Reference

Set reference voltage for GPIO. The reference voltage can be from external pins or internal reference voltage generator.

```
IO_PORT "xxx" VREF=VREF1_LOAD;
```

3.5.6 Hysteresis

Set the hysteresis value for input pins or bidirectional IO pins. The value is NONE, H2L, L2H, HIGH from small to large in sequence.

```
IO_PORT "xxx" HYSTERESIS=L2H;
```

3.5.7 Open Drain

Open Drain is available for both output and bidirectional IO pins. The values are ON and OFF.

```
IO_PORT "xxx" OPEN_DRAIN=ON;
```

3.5.8 Slew Rate

Specify slew rate for output pins or bidirectional IO pins. SLOW: low noise mode. FAST: high speed mode.

```
IO_PORT "xxx" SLEW_RATE=SLOW;
```

3.5.9 Termination Matching Resistors for Single-ended Signal

Set termination matching resistors for single-ended signals. The values are OFF and 100 ohm.

```
IO_PORT "xxx" SINGLE_RESISTOR=100;
```

3.5.10 Termination Matching Resistor for Differential Signal

Set termination matching resistors for differential signals. The values are OFF and 100 ohm.

```
IO_PORT "xxx" Diff_RESISTOR=100;
```

3.6 GPIO Primitive

IO Buffer with buffer function includes normal buffer, emulated LVDS, and true LVDS.

3.6.5 LVDS Input Buffer

Primitive Introduction

LVDS includes TLVDS_IBUF and ELVDS_IBUF.

True LVDS Input Buffer (TLVDS_IBUF).

Note!

GW1NZ-1 and GW1N-1S do not support TLVDS_IBUF.

Emulated LVDS Input Buffer (ELVDS_IBUF).

Note!

GW1NZ-1 does not support ELVDS_IBUF.

3.6.9 MIPI_IBUF

Primitive Introduction

MIPI Input Buffer (MIPI_IBUF) includes HS input mode and LP bi-direction mode, and HS mode supports dynamic resistance configuration.

Devices Supported

Table 3-10 MIPI_IBUF Devices Supported

Product Family	Series	Device
LittleBee®	GW1N	GW1N-9, GW1N-9C, GW1N-2

	GW1NSR	GW1NSR-2, GW1NSR-2C, GW1NSR-4, GW1NSR-4C
Arora	GW2AN	GW2AN-18X, GW2AN-9X

Functional Description

MIPI_IBUF supports LP and HS mode. IO and IOB are connected to pad.

LP mode: Supports bi-directional. When OEN is low, I is input and IO is output; when OEN is high, IO is input and OL is output; when OENB is low, IB is input and IOB is output; when OENB is high, IOB is input and OB is output.

HS mode: IO and IOB are the differential inputs. OH is the output, then HSREN controls the termination resistor.

3.6.11 MIPI_OBUF_A

Primitive Introduction

MIPI_OBUF_A includes HS mode and LP mode.

MIPI Output Buffer with IL Signal (MIPI_OBUF_A) is used as (HS) MIPI output buffer when MODESEL is high and used as (LP) MIPI output buffer when MODESEL is low. The difference with MIPI_OBUF is the addition of the IL port as an A input in LP mode.

Devices Supported

For the devices supported by MIPI_OBUF_A, apart from the devices listed in Table 3-12, you can also see the table below.

3.6.13 MIPI_IBUF_HS/MIPI_IBUF_LP

Primitive Introduction

MIPI_IBUF_HS implements HS mode for differential input and MIPI_IBUF_LP implements LP mode via single-ended input.

Devices Supported

Table 3-18 MIPI_IBUF_HS/MIPI_IBUF_LP Devices Supported

Family	Series	Device
LittleBee®	GW1NR	GW1NR-2

Functional Description

You can use the combination of MIPI_IBUF_HS and MIPI_IBUF_LP to support HS and LP modes via Floorplanner. Input I of MIPI_IBUF_HS and I of MIPI_IBUF_LP should be connected to the same signal, and input IB of MIPI_IBUF_HS and IB of MIPI_IBUF_LP should be connected to the same signal.

4 Input/Output Logic

I/O logic in GOWINSEMI FPGA products supports SDR and DDR modes, etc. In each mode, pin control (or pin differential signal pairs) can be configured as output signal, input signal, bi-directional signal and tristate output signal (output signal with tristate control).

Note!

- IOL6 and IOR6 pins of devices of GW1N-1, GW1NR-1, GW1NZ-1, GW1NS-2, GW1NS-2C, GW1NSR-2C, GW1NSR-2 and GW1NSE-2C do not support IO logic.
- IOT2 and IOT3A pins of GW1N-2, GW1NR-2, GW1N-1P5, GW1N-2B, GW1N-1P5B, GW1NR-2B devices do not support IO logic.
- IOL10 and IOR10 pins of the devices of GW1N-4, GW1N-4B, GW1NR-4, GW1NR-4B, GW1NRF-4B, GW1N-4C and GW1NR-4C do not support IO logic.

Figure 4-1 shows the output of the I/O logic in GOWINSEMI FPGA products.

Figure 4-1 I/O Logic View-Output

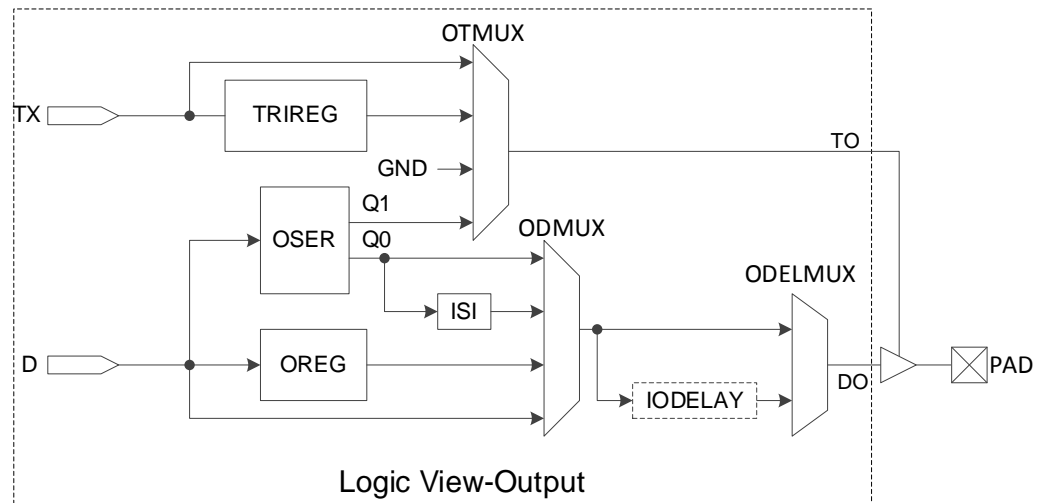

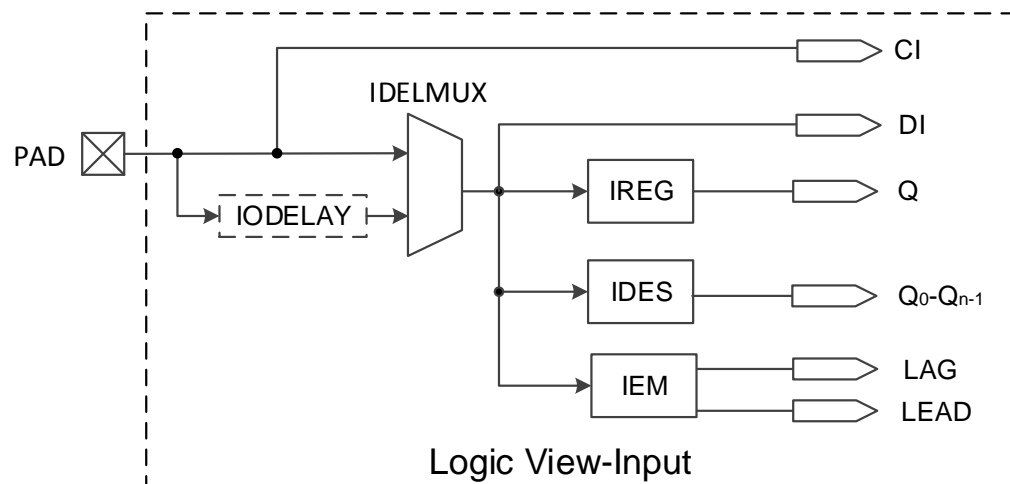

Figure 4-2 shows the input of the I/O logic in GOWINSEMI FPGA products.

Figure 4-2 I/O Logic View-Input

**Note !**

CI is the GCLK input signal and cannot connect to Fabric; DI is directly entered into Fabric.

4.1 SDR Mode

The input/output logic supports SDR mode and provides input register (IREG), output register (OREG) and tristate control register (TRIREG), the functions of which are the same as FF/LATCH in CFU. The FF/LATCH can be used as lologic when the input D of the FF/LATCH is driven by a Buffer/IODELAY that does not drive other lologics, or when the output Q of the FF/LATCH only drives a Buffer/IODELAY and the Buffer is not a MIPI Buffer.

4.2 DDR Mode Input Logic

4.2.1 IDDR

Primitive Introduction

Input Double Data Rate (IDDR)

Functional Description

Output data is provided to FPGA logic at the same clock edge in IDDR mode. IDDR logic diagram is as shown in Figure 4-3 and its timing diagram is as shown in Figure 4-4.

Name	Value	Default	Description
Q0_INIT	1'b0	1'b0	Initial value of Q0 output
Q1_INIT	1'b0	1'b0	Initial value of Q1 output

Connection Rule

Input D of IDDR can be directly from IBUF or from the output DO of IODELAY module.

Primitive Instantiation

The primitive can be instantiated directly, or generated by the IP Core Generator tool. For more information, you can refer to [5](#) IP Generation.

4.2.2 IDDRC**Primitive Introduction**

Dual Data Rate Input with Asynchronous Clear (IDDRC) is similar to IDDR to realize double data rate input and can be reset asynchronously.

Functional Description

Output data is provided to FPGA logic at the same clock edge in

IDDRC mode.

4.2.3 IDES4

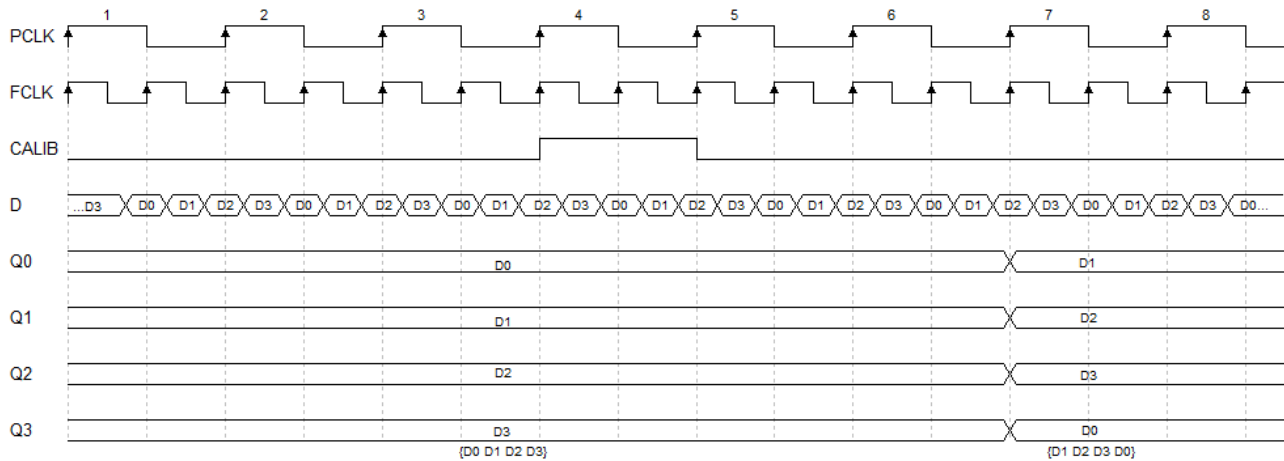

Primitive Introduction

The 1 to 4 Deserializer (IDES4) is a deserializer of 1 bit serial input and 4 bits parallel output.

Functional Description

IDES4 mode realizes 1:4 serial parallel conversion and output data is provided to FPGA logic at the same clock edge. CALIB is supported to adjust the sequence of output data. The data is shifted by one bit per pulse. After four shifts, the data output will be the same as the data before the shift. CALIB Timing diagram is as shown in Figure 4-7.

Figure 4-7 CALIB Timing Diagram

**Note!**

The pulse width and timing of the CALIB signal in the example are for reference only and can be adjusted as needed, the pulse width is equal to or greater than T_{PCLK} .

PCLK is usually obtained by FCLK frequency division:

$$f_{PCLK} = 1/2 f_{FCLK}$$

4.2.8 IDDR_MEM

Primitive Introduction

The Input Double Data Rate with Memory (IDDR_MEM) realizes double data rate input with memory.

Devices Supported

Table 4-16 IDDR_MEM Devices Supported

Product Family	Series	Device
Arora	GW2A	GW2A-18, GW2A-18C, GW2A-55, GW2A-55C
	GW2AN	GW2AN-55C
	GW2AR	GW2AR-18, GW2AR-18C
	GW2ANR	GW2ANR-18C

Functional Description

IDDR_MEM output data is provided to FPGA logic at the same clock edge. IDDR_MEM needs to be used with DQS. ICLK connects the DQSR90 of DQS output signals and sends data to IDDR_MEM according to the ICLK clock edge. WADDR [2: 0] connects the WPOINT output signal of DQS; RADDR [2: 0] connects the RPOINT output signal of DQS.

The frequency relation between PCLK and ICLK is $f_{PCLK} = f_{ICLK}$.

You can determine the phase relationship between PCLK and ICLK according to the DLLSTEP value of DQS.

4.2.9 IDES4_MEM

Primitive Introduction

The 1 to 4 Deserializer with Memory (IDES4_MEM) realizes 1:4 serial-parallel with memory.

Devices Supported

Table 4-19 IDES4_MEM Devices Supported

Product Family	Series	Device
Arora	GW2A	GW2A-18, GW2A-18C, GW2A-55, GW2A-55C
	GW2AN	GW2AN-55C
	GW2AR	GW2AR-18, GW2AR-18C
	GW2ANR	GW2ANR-18C

Functional Description

IDES4_MEM realizes 1:4 serial parallel conversion and the output data is provided to FPGA logic at the same clock edge. CALIB is supported to adjust the sequence of output data. Each pulse data is shifted by one bit. After four shifts, the data output will be the same as the data before the shift.

The ICLK connects the output signal DQSR90 of DQS and sends data to IDES4_MEM according to the ICLK clock edge. WADDR [2: 0] connects the output signal WPOINT of DQS; RADDR [2: 0] connects the output signal RPOINT of DQS.

The frequency relation between PCLK, FCLK and ICLK is

$$f_{PCLK} = 1/2 f_{FCLK} = 1/2 f_{ICLK}$$

You can determine the phase relationship between PCLK and ICLK according to the DLLSTEP value of DQS.

4.3 DDR Mode Output Logic

4.3.1 ODDR

Primitive Introduction

Dual Data Rate Output (ODDR)

Functional Description

ODDR mode is used for transferring double data rate signals from FPGA devices. Where Q0 is the double rate data output, Q1 is used for the OEN signal of IOBUF/TBUF connected by Q1. ODDR logic diagram is as shown in Figure 4-16 and its timing diagram is as shown in Figure 4-17.

4.3.5 OSER10

Primitive Introduction

The 10 to 1 Serializer (OSER10) is a serializer of 10 bits parallel input and 1 bit serial output.

Functional Description

OSER10 mode realizes 10:1 parallel to serial conversion. PCLK is usually obtained by FCLK frequency division, $f_{PCLK} = 1/5 f_{FCLK}$.

4.3.8 ODDR_MEM

Primitive Introduction

Dual Data Rate Output with Memory (ODDR_MEM) realizes double data rate output with memory.

Devices Supported

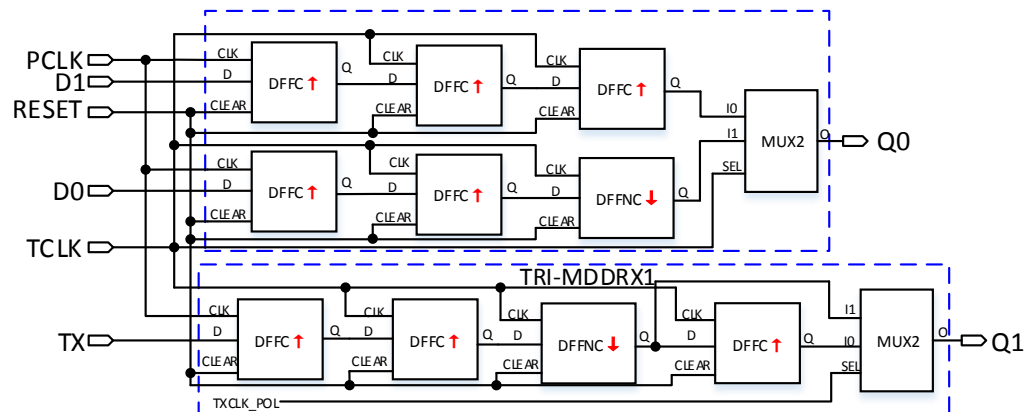

Table 4-40 ODDR_MEM Devices Supported

Product Family	Series	Device

	GW2AN	GW2AN-55C
	GW2AR	GW2AR-18, GW2AR-18C
	GW2ANR	GW2ANR-18C

Functional Description

ODDR_MEM mode is used for transferring double data rate signals from FPGA devices. Unlike ODDR, the output double data rate with memory (ODDR_MEM) needs to be used with DQS. TCLK connects to the DQSW0 or DQSW270 of DQS output signal, and outputs data from ODDR_MEM according to the TCLK clock edge. Where Q0 is the double rate data output, Q1 is used for the OEN signal of IOBUF/TBUF connected to Q0. Its logic diagram is as shown in Figure 4-28.

Figure 4-28 ODDR_MEM Logic Diagram

The frequency relation between PCLK and TCLK is $f_{PCLK} = f_{TCLK}$.

You can determine the phase relationship between PCLK and TCLK according to DLLSTEP and WSTEP value of DQS.

Functional Description

OSER8_MEM mode realizes 8:1 parallel serial conversion. The TCLK connects the output signal DQSW0 or DQSW270 of DQS, and outputs data from the OSER8_MEM according to the TCLK clock edge, and Q0 is the serial output, Q1 is used for the OEN signal of IOBUF/TBUF connected to Q0. Its logic diagram is as shown in Figure 4-32.

Figure 4-32 OSER8_MEM Logic Diagram

The frequency relation between PCLK, FCLK and TCLK is

$$f_{PCLK} = 1/4 f_{FCLK} = 1/4 f_{TCLK}$$

You can determine the phase relationship between FCLK and TCLK according to DLLSTEP and WSTEP values of DQS.

Connection Rule

- Q0 can directly connect to OBUF, or connect to input port DI in IODELAY module.
- Q1 shall connect to the OEN signal of IOBUF/TBUF connected to Q0, or left floating.
- TCLK needs DQSW0 or DQSW270 from DQS module and you need to configure the corresponding parameters.

4.4 Delay Module

4.4.1 IODELAY

Primitive Introduction

Input/Output delay (IODELAY) is a programmable delay unit in IO module.

Functional Description

Each IO contains an IODELAY module, providing a total of 128 (0~127) delays. The GW1N series of FPGA has a single-step delay time of about 30ps. And the GW2A series of FPGA has a single-step delay time of about 18ps. IODELAY can be used for input or output of I/O logic, but not for both at the same time.

5 IP Generation

The software only supports DDR at present. Click DDR in the IP Core Generator interface, and a summary of DDR will be displayed on the right side of the interface.

5.1 IP Configuration

Double-click "DDR", and the "IP Customization" window pops up. This includes the "File", "Options", and port diagram, as shown in Figure 5-1.

Figure 5-1 IP Customization of DDR

1. File: The File configuration box is used to configure the generated IP

design file.

- Device: Displays the configured Device.
 - Part Number: Displays the configured Part Number.
 - Language: Hardware description language used to generate the IP design files. Click the drop-down list to select the language, including Verilog and VHDL.
 - Synthesis Tool: Selects synthesis tools.
 - Module Name: The module name of the generated IP design files. Enter the module name in the text box. Module name cannot be the same as the primitive name. If it is the same, an error will be reported.
 - File Name: The name of the generated IP design files. Enter the file name in the text box.
 - Create In: The path in which the generated IP files will be stored. Enter the target path in the box or select the target path by clicking the option.
2. Options: The Options configuration box is used to customize the IP, as shown Figure 5-1.
- DDR Mode: Configures DDR mode, including input, output, tristate and bi-directional state;
 - Data Width: Configures the data width of the DDR. The range is 1~64;
 - Ratio: DDR data conversion ratio, including 2,4,7,8,10,16;
 - Reset: When Ratio is 2, this option can be enabled or disabled, and IDDR or ODDR will be instantiated when enabled;
 - IODELAY: Configures whether DDR uses a delay module;
 - "Delay Mode": Configures the delay mode. "None" means no IODELAY; "Dynamic" means using IODELAY and adjusting the delay step dynamically; "Static" means using IODELAY and adjusting the delay step statically.
 - "Delay Step": Selects the number of steps to statically adjust the delay, ranging 1 to 128.
 - "Delay Direction": In bidirectional mode, When DDR Mode is "bidirectional", if IODELAY is used, select whether IODELAY is connected to input or output.
 - Use CLKDIV: CLKDIV will be instantiated and the frequency of fclk will be divided when CLKDIV is enabled. When Ratio is 2, it cannot be checked.
3. Port Diagram: The port diagram displays a sample diagram of IP Core configuration, as shown in Figure 5-1.

5.2 IP Generation Files

After configuration, it will generate three files that are named after the "File Name".

- The IP design file "gowin_dds.v" is a complete verilog module, which generates DDR modules with corresponding functions according to the configuration.
- "Gowin_dds_tmp.v" is the template file;
- "gowin_padd.ipc" file is IP configuration file. You can load the file to configure the IP.

Note!

If VHDL is selected as the hardware description language, the first two files will be named with .vhd suffix.
